### Reading 3 Response

Simply from the first video I clicked into on [dontfeartheinternet.com](http://dontfeartheinternet.com), I was already able to learn a lot about HTML. Specifically, I was finally able to find a solution to a problem that has been bothering me for a long time concerning my portfolio. On my individual works pages in my portfolio website, I have pictures floating next to text with one single white background behind the two elements so as to provide a clean space in front of the interactive background of the whole website. Although, due to the single white background, I would sometimes have the white not spanning the whole image (of the work) and stopping at the text instead, leaving the bottom part of the image background-less depending on the size of the screen being used. Even after doing copious amounts of research, I was never able to find a simple solution to the problem. The only thing I could do was setting a specified height pixel for each work page, which was tedious and not interactive. Through one of the videos on [dontfeartheinternet](http://dontfeartheinternet.com), I learned that all I had to do was write the following code in css:

```
[parent element]: after {  
    display: block;  
    clear: both;  
    content: " ";  
    height: 0;
```

```
overflow: hidden
```

```
}
```

Having this issue solved is honestly such a relief. I never realized how much it bothered me until it was finally fixed. Now, all the white backgrounds on my pages are interactive and I no longer have to worry about someone having a different screen size than what I initially tested the portfolio on.
