### Reading#2

AR is actually simulating virtual things into real life scenes to achieve the effect of deceiving the eyeballs and the senses of the brain, thereby achieving a false-real experience. Through AR technology, you can turn a very calm environment into an extremely lively barbecue scene. This is the result of technological development. The potential of virtual reality is very likely to become a psychotropic substance, allowing people to indulge in the virtual online world and cannot extricate themselves.

With the development of technology, different technical fields have begun to interact with each other and have achieved good results. The interaction between hardware and software forms extremely powerful entertainment functions, such as TV, computer, PS4, and so on. AR entertainment is the trend of this era, and it is bound to come.
