Don't Fear the Internet

This reading was a short video series that introduced the basics of HTML and CSS. Being someone that already does have a little knowledge in code and creating a website, it was an amazing refresher on the basics. I have so much still to learn in both HTML and CSS and this is just scratching the surface of all of those things. The basic things that are needed in HTML include sectioning out your `<head>` and `<body>` as well as other built in indicators like `<p>` to write a paragraph or `<h1>`, `<h2>`, etc. to change the size of the font of your header, `<h1>` being the biggest and most important header. CSS comes in and does all the styling for the HTML blueprint. CSS is made for things like creating templates for full pages, changing color, and plenty of other styling things.

I am really excited to continue how to code in HTML and CSS so that I can continue to update my personal website. It is amazing to be able to create your own online portfolio to display the work you are proud of.
